

**FRV Walther Herwig III  
Cruise 370  
30.11. – 20.12.2013**

**Studies on Fish Diseases and Biological Effects of Contaminants  
in the North Sea and Baltic Sea**

Scientist in Charge: Dr. Thomas Lang

**Summary**

As part of the fish health monitoring programme of the Thünen Institute of Fisheries Ecology (FI), studies were carried out in seven Baltic Sea and six North Sea areas. The cruise also constituted the final sampling campaign of the EU-funded CHEMSEA project (2011-2014) and the first campaign within the NATO-funded MODUM project (2013-2016), both addressing ecological effects of dumped chemical munitions in the Baltic Sea. In addition to the onboard examination of dab (*Limanda limanda*), flounder (*Platichthys flesus*) and cod (*Gadus morhua*) for externally visible diseases and parasites, a large range of fish samples were taken for a subsequent analysis of contaminants (incl. radioactive substances) and their biological effects. Hydrographical measurements were carried out (water temperature, salinity, oxygen content, turbidity). The following preliminary findings were noted:

*Dab:* Elevated prevalence of lymphocystis, epidermal hyperplasia/papilloma and macroscopic liver neoplasms in the North Sea; increasing prevalence of some diseases on a north-westerly transect in the German North Sea EEZ from the inner German Bight to the Dogger Bank.

*Flounder:* Elevated prevalence of lymphocystis in the Baltic Sea;

*Baltic cod:* Low prevalence of acute/healing skin ulcerations and skeletal deformities; nematodes in the body cavity in all Baltic Sea areas, especially in the eastern sampling areas B13 (Bornholm Basin) and B09 (off Gdansk Bay).

**Participants:**

Name	Function	Institution
Dr. Thomas Lang	Scientist in Charge	TI-FI Cuxhaven
Nicolai Fricke	Scientist	TI-FI Cuxhaven
Jennifer Ipse	Technician	TI-FI Cuxhaven
Wolfgang Lindemann	Technician	TI-FI Hamburg
Horst Bahl	Scientist	TI-FI Hamburg
Marc Faber	Student	University Berlin
Lina Weirup	Student	University Hamburg
Christoph Rummel	Volunteer	University Mainz
Kolja Franssen	Volunteer	University Hamburg
Liliana Lehmann	Volunteer	University Berlin
Jessica Macken	Volunteer	University Göttingen
Shauna Grassmann	Volunteer	University Göttingen

## **Objectives of the Cruise**

1. Studies on fish diseases and parasites in the North Sea and Baltic Sea;
2. Studies on biological effects of contaminants;
3. Final studies for the CHEMSEA project and first studies in the MODUM project;
4. Sampling of fish for chemical analysis of contaminants;
5. Hydrographical measurements (salinity, temperature, oxygen, turbidity).

## **Dates of the Cruise**

FRV Walther Herwig III left Bremerhaven in the early morning of 30.11. The scientific crew already had boarded in the evening of 29.11. After the passage of Kiel Channel, the vessel sailed to the first sampling areas in the Baltic Sea, where work started in the morning of 01.12. in area B01 (Kiel Bight). In the following days, sampling was conducted in areas B10, B09 und SFI4. Due to a heavy storm (Xaver) fishing was not possible for three days. Work was resumed on 08.12. in area B13 east of Bornholm (dumpsite for chemical munitions after World War II) and continued in B11 and B12. In the evening of 10.12., after the end of the Baltic Sea programme, Walther Herwig III arrived in Kiel.

On 11.12., WHIII again passed Kiel Channel. In the period 12.-18.12., sampling was continued in four North Sea areas (P02, GB3, GB1, GB4, N01). The cruise ended according to schedule in the morning of 20.12. in Bremerhaven.

The location of the sampling areas and the cruise dates are shown in Fig. 1 and 2 and Tab. 1. In 9 sampling areas (Fig. 1), a total of 41 fishing hauls was performed (towing time 30–60 min. each) (geographical coordinates in Tab. 1, catch composition in Tab. 2). In the Baltic Sea, a 140 ft bottom trawl and a pelagic PSN 205 net were used, in the North Sea a GOV net, all with standard configuration. Hydrographical measurements were made at all fishery stations (geographical coordinates in Tab. 1a, results in Tab. 3).

## **Preliminary Results**

### **1 Dab (*Limanda limanda*)**

In total, 5,040 dab from one Baltic Sea and six North Sea areas were examined for the occurrence of externally visible diseases and parasites (Tab. 4) and 641 dab for the occurrence of liver anomalies (Tab. 5).

The prevalence of some diseases in the North Sea was increased compared to the previous summer cruise 2013 (WH cruise 367, 28.08.-12.09.2013). The prevalence of lymphocystis was in range of 4.4 % - 13.5 %, with the lowest value in the inner German Bight (area GB1) und the highest values in the north-westerly edge of the German EEZ on the Dogger Bank (area GB4). The prevalence of epidermal hyperplasia/papilloma was in the range of 1.7 % (Ekofisk, area P02) to 6.8% (Horns Reef, area N11). Marked regional variation was recorded for hyperpigmentation, with values between 19.9 % (inner German Bight, area GB1) and 40.7 % (Dogger Bank, area GB4). The strongest regional differences were noted for the parasite *Stephanostomum baccatum* (juvenile digenetic trematode under the skin), the prevalence of which ranged from 6.3 % (inner German Bight, area GB1) to 99.9 % (Ekofisk, area P02).

For the majority of diseases, there was a prevalence gradient – as during the previous summer cruise (WH cruise 367, 28.08.-12.09.2013) – in the German EEZ in north-westerly direction, with increasing values from the inner German Bight (area GB1) to the Dogger Bank (area GB4) (see Fig. 3. and Tab. 4). When interpreting this finding, it has to be taken into account that the mean total length of the dab examined increased in north-westerly direction, too, possibly affecting the prevalence, but not exclusively responsible for the gradient recorded.

The prevalence of liver nodules >2 mm (= tumours and pre-stages) was elevated North Sea dab compared to previous cruises. For dab of the size range 20-24 cm total length was in the range of 1.9 % (German Bight, areas N01 and GB1) to 22.2 % (Dogger Bank, area GB4), for dab of the size

group  $\geq$  25 cm the prevalence ranged from 10.4 % (Horns Reef, area N11) to 23.7 % (Dogger Bank, area GB4).

Baltic Sea dab from Kiel Bight (area B01) displayed differences in disease prevalence to the North Sea dab especially for hyperpigmentation and the parasites *Stephanostomum baccatum*, *Acanthochondria cornuta* (copepode on the gills) and *Lepeophtheirus pectoralis* (copepode on the skin and under the pectoral fins). These diseases/parasites are extremely rare in the Baltic Sea.

## **2 Flounder (*Platichthys flesus*)**

1,079 flounder from six Baltic Sea areas and one of the North Sea areas (inner German Bight, area GB1) were examined for the occurrence of externally visible diseases and parasites (Tab. 6). The prevalence of lymphocystis in the Arkona Sea was high compared to the summer cruise 2013 (WH 367) (area B10: 28.5 %; area B11: 18.6 %). For *Lepeophtheirus pectoralis*, the marked regional pattern previously known was confirmed. A high prevalence occurred in the inner German Bight (area GB1, North Sea) and Kiel Bight (area B01, Baltic Sea), lower prevalence in flounder from Mecklenburg Bight (area B12) and zero prevalence in the eastern Baltic Sea sampling areas.

## **3 Cod (*Gadus morhua*)**

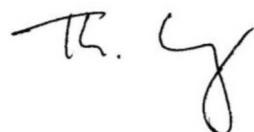

In total, 2,012 cod from seven Baltic Sea areas and five North Sea areas (in the latter only single specimens, so results cannot be regarded as representative) were examined for externally visible diseases and parasites and for nematodes in the body cavity (Tab. 7). The disease prevalence was low in general, and for acute/healing stages the maximum values were below 9.0 %. Skeletal deformities were rare, too, with maximum values of 1.3 % (in areas B01, B09, B11). Larval nematodes in the body cavity were recorded in all Baltic Sea areas and were most prevalent in the eastern areas B13 east of Bornholm (83.3 % of six cod examined) and B09 off Gdansk Bay (27.3 % of 150 cod examined).

## **4 Miscellaneous**

The mean catch data of the most frequent fish species are provided in Tab. 2; Tab. 3 gives results of the hydrographical measurements.

## **Acknowledgements**

Thanks are due to Captain Karow and his crew and to the scientific staff for constructive and hard work and a very good atmosphere on board.

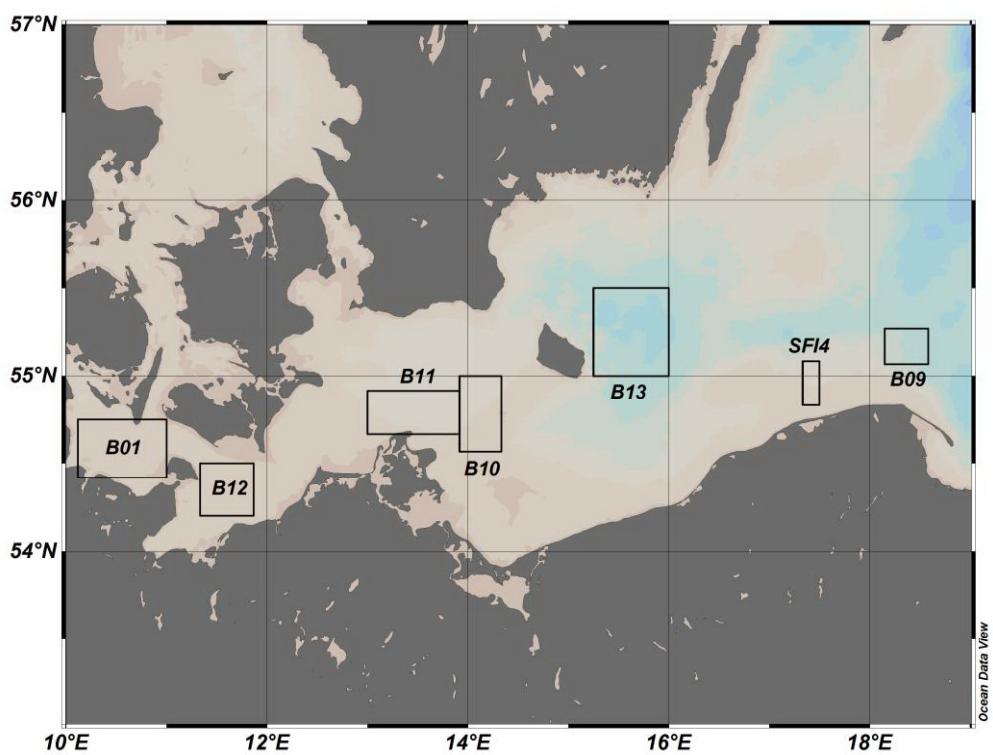

Dr. Thomas Lang

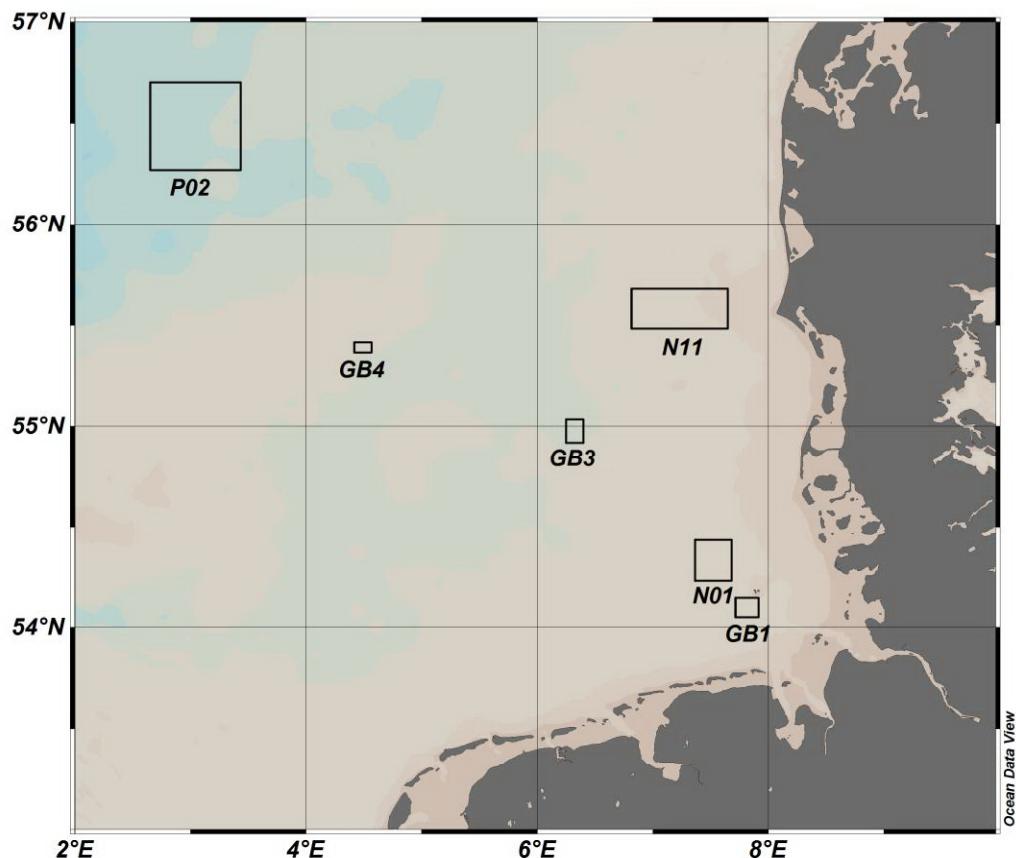

(Scientist in Charge)
