

**FRV Walther Herwig III
Cruise 390
04.12. - 19.12.2015**

Studies on fish diseases and biological effects of contaminants in the western Baltic Sea

NATO project MODUM

Scientist in Charge: Dr. Marc-Oliver Aust

Summary

As part of the monitoring programme of the Thünen Institute of Fisheries Ecology (FI) on the health status of fish in the North and the Baltic Sea and as part of the NATO-funded project MODUM, research was carried out in five areas of the Baltic Sea. The second part of the cruise planned in the North Sea was cancelled due to technical problems with the research vessel and due to heavy weather conditions. Besides the examination for macroscopic externally and internally visible fish diseases and parasites of dab (*Limanda limanda*) and cod (*Gadus morhua*) on board, samples for a subsequent analysis of contaminants and their biological effects were taken.

Furthermore inspections on the health status of cod were carried out in dumpsites of chemical warfare agents and reference sites in the framework of the MODUM-Project (2013-2016). Additionally, hydrographical measurements were carried out (water temperature, salinity, oxygen content, turbidity). Preliminary results were as follows:

Dab: Only one site was sampled (B01, Kiel Bight); no abnormalities compared to earlier cruises detected

Baltic Sea Cod stock: Low infection rates of skin ulcers and skeletal deformities; nematodes in the body cavity at all Baltic Sea sites, especially abundant in the eastern sites B13 (Bornholm Basin) and B09 (near Gdansk Bay). Comparable infection rates of the gill parasite *Lernaeocera branchialis* at sites in the Arkona Sea and of the skin parasite *Cryptocotyle lingua* in Kiel Bight; generally high infection rates with the gill parasite *Loma branchialis*.

Participants:

| Name | Function | Institution |
|----------------------|---------------------|-------------------------|
| Dr. Marc-Oliver Aust | Scientist in Charge | TI-FI Hamburg |
| Jennifer Ipse | Technician | TI-FI Cuxhaven |
| Maik Siegmund | Technician | TI-FI Cuxhaven |
| Nadine Dichte | Technician | TI-FI Hamburg |
| Dr. Bernhard Allner | Scientist | GOBIO-GmbH |
| Thomas Schmidt | Scientist | GOBIO-GmbH |
| Sandra Bisenius | Scientist | LAVES Cuxhaven |
| Johannes Höhn | Student | University of Rostock |
| Fabian Deister | Student | University of Oldenburg |
| Jan Römer | Student | University of Hamburg |
| Hendrik Stoltz | Student | University of Rostock |

Objectives of the cruise

1. Studies on fish diseases and parasites in the North and the Baltic Sea;
2. Studies on biological effects of contaminants;
3. Sampling of fish for contaminant analyses;
4. Use of CTD and water sampling for hydrographical measurements (salinity, temperature, oxygen and turbidity).

Dates of the cruise

FRV Walther Herwig III left Bremerhaven in the morning of 04.12.2015 with a delay of three days due to necessary maintenance work. A part of the scientific crew was already on board since 30.11.2015. The vessel was on target for Helgoland where it took shelter from heavy storms. Afterwards, it transited through the Kiel Canal on 07.12.15. The vessel proceeded to the first research site in the Baltic Sea close to the Island of Rügen (B11), where the work started in the morning of 08.12.15. Sampling continued at sites B13, B09, B10 und B01 (13./14.12.) during the following days. FRV Walther Herwig III entered Kiel port on 14.12., where the scientists S. Bisenius and Dr. B. Allner left the scientific crew.

The vessel could not pass Kiel Canal (as planned) due to technical problems with the primary engine, which could only be provisionally repaired. Therefore, on 16.12. Walther Herwig III started the return to the North Sea via Skagen. The North Sea part of the cruise had to be cancelled because of the bad shape of the vessel and poor weather forecast. As a result, Walther Herwig III arrived at Bremerhaven in the morning of 19.12., where the cruise ended two days ahead of schedule.

The location of the sampling areas and exact cruise dates are shown in Fig. 1 and in Tab.1. A total of 16 fishing hauls (trawling time 48 to 60 minutes) were performed using the 140ft bottom trawl and the pelagic PSN 205 in five sampling areas (Fig. 1; see Tab. 1 for coordinates and Tab. 2 for catch composition). Hydrographical measurements were carried out at each fishery station (see Tab. 1a for geographical coordinates and Tab. 3 for results).

Preliminary Results

1 Dab (*Limanda limanda*)

In total, 684 dab (total length \geq 10 cm) from one sampling area were examined for the occurrence of externally and internally visible diseases and parasites (Tab. 4) and 100 dab for for the occurrence of liver anomalies (Tab. 5).). The results were similar to earlier cruises. As stated above, no sampling was possible in the North Sea.

2 Flounder (*Platichthys flesus*)

A total of 562 flounder from four Baltic Sea areas were examined for the occurrence of externally and internally visible diseases and parasites (Tab. 6). The infection rates with Lymphocystis ranged from 30,9 % (Kiel Bight, site B01) to 42,9 % (Arkona Basin, site B10). Infection rates of acute/ healing skin ulcers were as low as observed during previous cruises. The only exception was site B09, where an increased value of 12,5 % was determined like already found in December 2014; only eight flounder were examined here.

3 Cod (*Gadus morhua*)

In total, 862 cod from five Baltic Sea areas were examined for the occurrence of externally and internally visible diseases and parasites, thereof 392 for nematodes in the body cavity (Tab. 7). Infection rates for acute/healing skin ulcers ranged from 0,0 % in Kiel Bight (site B01) to 8,0 % at Gdansk Bay (site B09). This means that infection rates at sites in Gdansk Bay and Arkona Basin (B09, B10 and B11) were slightly higher compared to cruises in Dec. 2014 and Aug./Sept. 2015. Skeletal deformities were only rarely detected, the maximum percentage was 2,8 % (Arkona Basin, site B10). Larval nematodes in the body cavity were recorded in cod from all Baltic Sea areas, with the highest prevalence in the easternmost areas B13 (Bornholm Basin; 60,0 %) and B09 (Gdansk Bay; 40,5 %). The increased occurrence of the gill parasite *Lernaeocera branchialis* in cod of the Arkona Basin (sites B10: 9,4 % and B11: 12,0 %) was a striking result. Furthermore, the frequency of determination of

the parasite *Cryptocotyle lingua* (black spot trematode inside the skin) was again high in Kiel Bight (Site B01, at 51,1 %). The gill parasite *Loma morhua* (Microspora) was detected in all areas at high prevalence (93,3 % - 100,0 %).

4 Miscellaneous

The mean catch data of the most frequent fish species are provided in Tab. 2; Tab. 3 gives results of the hydrographical measurements.

Acknowledgements

Thanks are due to Captain Vandrei and his crew as well as to the scientific staff for constructive and hard work and a very good atmosphere on board under bad surrounding conditions.

Dr. Marc-Oliver Aust
(Scientist in Charge)
