

# CatchMonitor

AUTOMATED BY-CATCH QUANTIFICATION MICHAL MACKIEWICZ

UNIVERSITY OF EAST ANGLIA – MARINE SCOTLAND SCIENCE – CEFAS

#### CatchMonitor

- CatchMonitor is part of SMARTFISH, funded by EU Horizon 2020
- CatchMonitor built on prior work funded by Marine Scotland from 2014

## Overview

#### CatchMonitor

- CatchMonitor is an automated by-catch quantification system
- Process surveillance footage of on-board conveyor belts
- Uses state of the art computer vision and AI to quantify by-catch in the video footage

#### CatchMonitor: what it does

Surveillance footage as input

#### CatchMonitor: what it does

- Spreadsheet listing discards as output
  - Species of each fish
  - The time in the video when it was discarded

Discard	Time	Species
1	0:02:38.224810	Saithe
2	0:02:40.468198	Herring
3	0:02:41.325964	Saithe
4	0:02:41.589892	Saithe
5	0:02:43.305423	Haddock
6	0:02:49.573712	Saithe
7	0:02:49.573712	Norway pout
8	0:02:50.365496	Argentines

#### CatchMonitor: status

- A working prototype has been developed
- We have evaluated its performance in comparison to expert observers from Cefas and Marine Scotland Science

## Requirements

#### CatchMonitor: requirements

- CatchMonitor was developed with a view to minimizing the impact on the work practices of existing fishing vessels
- Development of CatchMonitor has suggested requirements for deployment
  - Camera
  - Calibration
  - Non-work area at discard end of conveyor belt
  - Maintenance: cleaning

#### CatchMonitor requirements: camera

- Dome covered surveillance camera over the discard chute end of the conveyor belt
- ▶ HD camera; 720p resolution or better
- Frame rate of at least 25 frames per second (similar to TV)

#### CatchMonitor requirements: calibration

- Calibration setup
  - Performed once at installation
  - Performed if the camera is changed

# CatchMonitor requirements: non-work area

- Ideally the last 50-75cm of the belt adjacent to the discard chute should not be a work area
  - To prevent working fishers from obscuring the cameras' view of the belt

# CatchMonitor requirements: non-work area

An obscured view of the discard end of the belt hampers the performance of our system

#### CatchMonitor requirements: maintenance

- The dome covering the camera will need regular cleaning
- The fish gutting process can throw spatter onto the dome
- Spatter on the dome obscures the view and significantly degrades performance

### Method

#### IN A NUTSHELL

▶ Fish are detected and their outlines estimated

Segmentation

#### Aside: CatchMonitor - Annotation Tool

Motion of fish tracked throughout the video

Fish that cross over into the discard chute region (dashed yellow line) are counted as by-catch

Images of fish identified as by-catch are extracted

Individuals are classified according to species

## Performance

#### Confusion matrices

- Shows the proportion of samples of each species (e.g. haddock) that the model predicts as each other species (including e.g. haddock)
  - E.g. Of all the haddock in the data
    - ► 52.1% were successfully predicted as Haddock
    - ▶ 12.8% were mis-identified as Norway Pout, 7% as Saithe, etc.

#### Confusion matrices

- Row = true species
- Column = predicted species
- Strong performance indicated by dark band (high values) along top-left to bottom-right diagonal
  - > This indicates that the model successfully identified e.g. haddock as haddock
- ▶ High values off-diagonal indicate that species was mis-identified
- Extra column to right to indicate false negatives (uncounted discards)
- Extra row at bottom to indicate false positives (over-predicted discards)
- We will also summarise the performance of the algorithm in the context of inter-reviewer variability

### Demo video

HTTPS://WWW.YOUTUBE.COM/W ATCH?V=OLU\_CZAYTKK

#### Catchmonitor: summary

#### CatchMonitor is a working prototype

- Automatically quantifies by-catch from surveillance videos captured onboard fishing trawlers
- Testing has shown inter-reviewer variability in count accuracies across each vessel were high and the algorithm count accuracy was typically close to the lowest individual count accuracy of the reviewers. Therefore, the performance of the algorithm is more or less equal to the lower ability end of "expert" human reviewers.
- With additional training data and further development we expect to reach accuracy sufficient for industrial application

Innovation for sustainable fisheries

## Thank you!
